

# Exmonitor

**Data Sheet** 

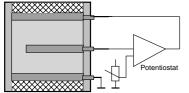

**Gas Measuring and Alarm Systems** 

| Application/Structure | <ul> <li>The sensors of the series Exmonitor/Gasmonitor used in combination with the analysis systems have the following functions:</li> <li>Measuring and displaying the current concentration of toxic gases and of oxygen.</li> <li>Monitoring and warning signal for: <ul> <li>Excessive concentrations of toxic gases.</li> <li>Lack of oxygen.</li> </ul> </li> <li>Initiating protection measures: <ul> <li>Technical: the increase in concentration is counteracted, or adequate oxygen content/supply is ensured. (ventilator, cut-out functions).</li> <li>Organisation: optical and acoustic alarms.</li> </ul> </li> <li>A gas alarm unit comprises the following components: <ul> <li>Sensor</li> <li>Analysis system</li> <li>Controllable units such as ventilators, warning lights and solenoids.</li> </ul> </li> </ul>  |
|-----------------------|---|
| Product features      | <ul> <li>Detection of toxic gases and oxygen</li> <li>Measuring principle: electro-chemical measuring cell</li> <li>Linear measuring signal: 4-20 mA</li> <li>Dual conductor design</li> <li>One-man calibration</li> <li>Easy change of sensor</li> <li>Two construction designs: <ul> <li>Exmonitor for potentially explosive atmospheres with continuous display of gas concentrations</li> <li>Gasmonitor for non-hazardous areas</li> </ul> </li> <li>Exmonitor: ATEX-conformity for applications in hazardous areas zone 1 and 2</li> </ul>   |
| Mode of function      | <ul> <li>3-electrode sensor for toxic gases         The eletrodes are surrounded by an electrolyte. The upstream Teflon             membrane protects the cell from exposure to dust and moisture. A capillary             diffusion barrier ensures that only a limited quantity of test gas reaches the             inside of the cell. This also helps to minimize the pressure inflow. The             electro-chemical reaction (charge crossover) takes place at the measuring             electrode. The potential conditions of the sensor change as a consequence.             The potential changes are measured above the reference electrode. The             counter electrode is addressed by a potentiostat (controlled diffusuin) such             that the potential changes of the cell are compensated. The oxygen             required for this process is drawn from the ambient air to the inside of the             cell.            Dual electrode sensor for oxygen measurements</li></ul> |
| 3-Elektroden-Sensor   | • Dual electrode sensor for oxygen measurements<br>The electrodes are surrounded by an electrolyte. The upstream Teflon<br>membrane protects the cell from exposure to dust and moisture. The<br>diffusing oxygen causes a reaction at the measuring electrode. As a<br>consequence, the potential conditions of the sensor change and the cell   |

suplies a measuring current.

•

**Electronics** The electronic system includes an amplifier, a 4-20 mA transmitter and operating elements. The sensor signal is amplified and converted into a 4-20 mA signal. The latter is transmitted to the analysis unit, shown as current value in the display, and finally analyzed.

Exmonitor / Gasmonitor Data Sheet

| Mode of function • | <b>Calibrating the mesuring sensor</b><br>During calibration the sensor delivers a pulsating output signal. The<br>connected analysis unit thus suppresses an alarm output. A malfunction<br>signal is transmitted at the same time. An additional voltage meter is<br>required for the sensor of the type Gasmonitor because this sensor (unlike<br>the Exmonitor) has no display.  |
|--------------------|--|
| •                  | <ul> <li>Direct sensor calibration using test gas:<br/>Select the operating mode "cal gas". Test gas is applied to the sensor and the unit is calibrated with the help of the display (or the connected measuring instrument when using the Gasmonitor) and the potentiometers for zero and amplification. Finally, the sensitivity (calibration number) of the sensor can be read.</li> <li>Without test gas using a calibrated sensor:<br/>Plug in a sensor filled with test gas. Zero is set in air free of test gas.<br/>This sensor carries a calibration number. Finally, using the potentiometer for sensitivity, set the display to the calibration number of the sensor.</li> </ul> |
